Package 'bigsparser'

October 12, 2022

Title Sparse Matrix Format with Data on Disk

Version 0.6.1

Description Provide a sparse matrix format with data stored on disk, to be used in both R and C++. This is intended for more efficient use of sparse data in C++ and also when parallelizing, since data on disk does not need copying. Only a limited number of features will be implemented. For now, conversion can be performed from a 'dgCMatrix' or a 'dsCMatrix' from R package 'Matrix'. A new compact format is also now available.

License GPL-3

Encoding UTF-8

RoxygenNote 7.1.1

URL https://github.com/privefl/bigsparser

BugReports https://github.com/privefl/bigsparser/issues

Depends R (>= 3.1)

LinkingTo Rcpp, RcppEigen, rmio

Imports Rcpp, bigassertr, methods, Matrix, rmio (>= 0.4)

Suggests testthat (>= 2.1.0)

NeedsCompilation yes

dim,SFBM-method   *Dimension and type methods for class* SFBM.

Description

Dimension and type methods for class SFBM.

Usage

```
## S4 method for signature 'SFBM'
dim(x)

## S4 method for signature 'SFBM'
length(x)
```

Arguments

x   An object of class [SFBM](#).

SFBM-class   *Class SFBM*

Description

A reference class for storing and accessing sparse matrix-like data stored in files on disk.

Convert a 'dgCMatrix' or 'dsCMatrix' to an SFBM.

Usage

```
as_SFBM(spmat, backingfile = tempfile(), compact = FALSE)
```

Arguments

spmat	A 'dgCMatrix' (non-symmetric sparse matrix of type 'double') or 'dsCMatrix' (symmetric sparse matrix of type 'double').
backingfile	Path to file where to store data. Extension .sbk is automatically added.
compact	Whether to use a compact format? Default is FALSE. This is useful when non-zero values in columns are contiguous (or almost).

Details

An object of class SFBM has many fields:

- `$address`: address of the external pointer containing the underlying C++ object to be used as a `XPtr<SFBM>` in C++ code
- `$extptr`: (internal) use `$address` instead
- `$nrow`: number of rows
- `$ncol`: number of columns
- `$nval`: number of non-zero values
- `$p`: vector of column positions
- `$backingfile` or `$sbk`: File with extension 'sbk' that stores the data of the SFBM
- `$rds`: 'rds' file (that may not exist) corresponding to the 'sbk' file
- `$is_saved`: whether this object is stored in `$rds`?

And some methods:

- `$save()`: Save the SFBM object in `$rds`. Returns the SFBM.
- `$add_columns()`: Add new columns from a 'dgCMatrix' or a 'dsCMatrix'.

Value

The new [SFBM](#).

Examples

```
spmat2 <- Matrix::Diagonal(4, 0:3)
spmat2[4, 2] <- 5
spmat2[1, 4] <- 6
spmat2[3, 4] <- 7
spmat2

# Stores all (i, x) for x != 0
(X2 <- as_SFBM(spmat2))
matrix(readBin(X2$sbk, what = double(), n = 100), 2)

# Stores only x, but all (even the zero ones) from first to last being not 0
(X3 <- as_SFBM(spmat2, compact = TRUE))
X3$first_i
readBin(X3$sbk, what = double(), n = 100)
```

SFBM_compact-class   *Class SFBM_compact*

Description

A reference class for storing and accessing sparse matrix-like data stored in files on disk, in a compact format (when non-zero values in columns are contiguous).

Details

It inherits the fields and methods from class SFBM.

---

sp_prodVec   *Products with a vector*

Description

Products between an SFBM and a vector.

Usage

```
sp_prodVec(X, y)

sp_cprodVec(X, y)
```

Arguments

X   An SFBM.

y   A vector of same size of the number of columns of X for sp_prodVec() abd as
                     the number of rows of X for sp_cprodVec().

Value

- sp_prodVec(): the vector which is equivalent to X %*% y if X was a dgCMatrix.

- sp_cprodVec(): the vector which is equivalent to Matrix::crossprod(X, y) if X was a dgCMatrix.

Examples

```
spmat <- Matrix::rsparsematrix(1000, 1000, 0.01)
X <- as_SFBM(spmat)
sp_prodVec(X, rep(1, 1000))
sp_cprodVec(X, rep(1, 1000))
```

---

sp_solve_sym   *Solver for symmetric SFBM*

Description

Solve Ax=b where A is a symmetric SFBM, and b is a vector.

Usage

```
sp_solve_sym(
  A,
  b,
  add_to_diag = rep(0, ncol(A)),
  tol = 1e-10,
  maxiter = 10 * ncol(A)
)
```

Arguments

A	A symmetric [SFBM]().
b	A vector.
add_to_diag	Vector (or single value) to *virtually* add to the diagonal of A. Default is 0s.
tol	Tolerance for convergence. Default is 1e-10.
maxiter	Maximum number of iterations for convergence.

Value

The vector x, solution of Ax=b.

Examples

```
N <- 100
spmat <- Matrix::rsparsematrix(N, N, 0.01, symmetric = TRUE)
X <- bigsparser::as_SFBM(as(spmat, "dgCMatrix"))
b <- runif(N)

test <- tryCatch(as.vector(Matrix::solve(spmat, b)), error = function(e) print(e))
test2 <- tryCatch(sp_solve_sym(X, b), error = function(e) print(e))

test3 <- as.vector(Matrix::solve(spmat + Matrix::Diagonal(N, 1:N), b))
test4 <- sp_solve_sym(X, b, add_to_diag = 1:N)
all.equal(test3, test4)
```

```
[,SFBM,ANY,ANY,ANY-method
```
                              Accessor methods for class SFBM.

Description

Accessor methods for class SFBM.

Usage

```
## S4 method for signature 'SFBM,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'SFBM_compact,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]
```

Arguments

x	A [SFBM](#) object.
i	A vector of indices (or nothing). You can use positive and negative indices, and also logical indices (that are recycled).
j	A vector of indices (or nothing). You can use positive and negative indices, and also logical indices (that are recycled).
...	Not used. Just to make [nargs](#) work.
drop	Not implemented; always return a sparse matrix (drop = FALSE).

Examples

```
spmat <- Matrix::Diagonal(4, 0:3)
spmat[4, 2] <- 5
spmat[1, 4] <- 6
spmat[3, 4] <- 7
spmat

X <- as_SFBM(spmat)
X[1:3, 2:3]
X[, 4]   # parameter drop is not implemented
X[-1, 3:4]

X2 <- as_SFBM(spmat, compact = TRUE)
X2[1:3, 2:3]
```
