Title 'hms' Based Timer

Version 0.2.1

Description Tracks elapsed clock time using a `hms::hms()` scalar, which if running has an attribute named start that specifies the system time when the timer was started. The elapsed time is the value of the scalar plus the difference between the current system time and the system time when the timer was started.

`hms_timer` *hms Timer*

Description

A hms Timer is a `hms::hms()` scalar which if running has an attribute named start that specifies the system time when the timer was started.

Details

The elapsed time is the value of the scalar plus the difference between the current system time and the system time when the timer was started.

Examples

```
str(tmr_timer())
str(tmr_timer(1.5, start = TRUE))

x <- tmr_timer(1, start = TRUE)
print(x)
Sys.sleep(0.1)
print(x)
print(tmr_elapsed(x))
print(x)
```

`tmr_ceiling` *Ceiling hms Timer*

Description

```

Arguments

x	A hms_timer().

Details

The elapsed time is the value of the scalar plus the difference between the current system time and the system time when the timer was started.

If the original hms_timer() was running then the new hms_timer() is assigned an attribute named start of the current system time.

Value

A hms_timer() of the elapsed time.
